WPI; 2001-266143/27.

New human type complementation-determining region-transplanted antibody and derivatives against ganglioside GD3, useful in diagnosis and therapy of e.g. tumors, with low antigenicity, little side effects but potent

in cancer.

The present invention describes a monoclonal antibody which can react specifically with ganglioside GD3. The antibody and its derivatives are useful in the diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a protein used in the exemplification of the invention Claim 11; Page 174-175; 183pp; Japanese.

The drugs can be used to treat tumour like melanoma and can provide a treatment with enhanced therapeutic effect and little side-reaction, particularly to relieve problems of side-effects during the conventional single administration. This sequence represents a protein associated with the anti- ganglioside GD3 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drugs containing genetically-modified antibody against ganglioside GD3, its fragment, immunocompetent cell activators or/and antitumor agents i combination, applicable in treating malignant tumor like melanoma.

                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                The present sequence is a murine immunoglobulin light chain variable region from plasmid KM-641. The coding sequence was used in the creation of an expression vector, along with the sequence for a human antibody, to produce humanised chimaeric antibodies, which can be used to treat cancer. Humanised chimaeric antibodies are more effective than mouse antibodies as they do not provoke a reaction in the human and side effects, such as the formation of anti-mouse immunoglobulin antibody and the rapid half-life of the immunoglobulins, do not occur
                                                                                                                                                                                                                                                                                                            Sequence 128 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes drugs contain a genetically-modified antibody against ganglioside GD3 or its fragment and at least 1 of a substance capable of activating immunocompetent cells and a substance having an antitumor activity in combination. The drugs can be used to treat tumour like melanoma and can provide a treatment with enhanced therapeutic effect and little side-reactions, particularly to relieve problems of side-effects during the conventional single administration. This sequence represents a protein associated with the anti- ganglioside GD3 antibody
                     This immunoglobulin region was isolated from pKM641LA2. A methionine codon, presumably the initiation codon ATG, was found in the vicinity the 5' terminus and the sequence has a full length leader sequence. The chimeric human antibodies are useful in the treatment of cancer, especially that which is of neural ectodermal origin. In contrast to

                                                             variable regions respectively. The DNA sequences encoding these proteins were used in the construction of humanised chimeric antibody expression vectors. In these humanised antibodies none of the amino acids of the nor human animal Ab variable region have been changed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chimeric human antibodies have a prolonged half-life and a reduced frequency of adverse effects when compared to mouse monoclonal antibodies
                                                                                                                                                            Humanised chimeric antibody prodn. against ganglioside {\tt GD3} -cancers, such as melanoma, neuroblastoma, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                          Example 2 describes the construction of the vector pChi641HAl for chimeric human antibody H chain expression. mRNA from mouse anti-CD3 monoclonal Ab KM641-producing cells was isolated and KM641 H and L chain cDNA plated. The base sequences of the Ig variable regions in KM641 H chain cDNA (pKM641HA3) and KM641 L chain cDNA (pKM641LA2) are given in AAQ45418-39. A KM641-derived chimeric human Ab H chain expression vector was constructed by joining the H chain variable region gene from pKM641HA3 to a vector for chimeric human Ab H chain expression using the synthetic DNAs given in AAQ63439 and AAQ63440
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monoclonal antibody; Ab; ganglioside GM2; chimera; chimeric antibody; expression vector; heavy; light; chain; hypervariable region; CDR; constant region; hybridoma; Ig; immunoglobulin; promoter; enhancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Humanised antibody specific for ganglioside GM2 - used for producing a cytocidal effect on cancers such as melanoma, neuroblastoma and glioma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mus musculus.
                                                                                                                                                                                                                                                                                                               Sequence 128

                                                                                                                                                                                                                                                                                                                       The present sequence is the light chain variable region of the anti-human Fas ligand monoclonal antibody (MAb) NOK-1 is produced by the hybridoma NOK-1 (FERM BP-5044), which was prepared by immunising mice with transformed human Fas ligand expressing COS cells, and fusing spleen cells isolated from the mice with myeloma 23x63Ag8.653 (ATCC CRL-1580) cells. The MAb recognises the human Fas ligand on the cell surface or in solution, and can be used to inhibit the application inducing cell surface Fas ligand/Fas reaction. The MAb can also be used for a Fas ligand assay in biological samples (e.g. human blood), especially for disease

It is used in the construction of a chimeric MAD comprising heavy and light chains having murine V regions and human C regions. The chimeric MADs are more effective than murine MAD 1C11 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MADs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV. See also AAQ12056-60 and AAQ12056-63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a variant light chain variable region of the anti-
human Fas ligand monoclonal antibody (MAb) NOK-1. NOK-1 is produced by
the hybridoma NOK-1 (FERM BP-5044), which was prepared by immunising mice
with transformed human Fas ligand expressing COS cells, and fusing spleen
cells isolated from the mice with myeloma P3x63Ag8.653 (ATCC CRL-1580)
cells. The MAb recognises the human Fas ligand on the cell surface or in
solution, and can be used to inhibit the apoptosis inducing cell surface
Fas ligand/Fas reaction. The MAb can also be used for a Fas ligand assay
in biological samples (e.g. human blood), especially for disease
diagnosis, e.g. hepatitis, infectious mononucleosis and systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-MAR-1995;

The MAD can be used in the preparation of a composition for the effective oral or parenteral virus. The composition controls apoptosis in liver cells caused by the binding of Fasi to Fas expressing liver cells, and improves liver function by improving blood glutamate oxaloacetate and pyruvate transaminase levels. The composition is given in a dosage of 0.0001-1000, preferably 0.01-600 mg/day. Spleen cells from mice immunised with Fasi expressing COS cells were fused with mouse myeloma cells to produce hybridomas. The hybridomas were screened for anti-Fasi activity, and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a monoclonal antibody which can react specifically with ganglioside GD3. The antibody and its derivatives are useful in the diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a protein used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                   Key
Region
        New fusion protein comprising functionally linked components of an au CD7 antibody or its fragment and an immunotoxin, useful for treating positive acute T-cell and/or myeloid leukemias, or Graft-versus-host
                                                                                                                                                                                                                                                      Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human type complementation-determining region-transplanted antibody and derivatives against ganglioside GD3, useful in diagnosis and therapy of e.g. tumors, with low antigenicity, little side effects but potent

```
The present sequence is that of a novel fusion protein comprising an scfv CC fragment of anti-CD7 monoclonal antibody TH-69 and domains II and III of CB Pseudomonas exotoxin A (ETA), joined via a peptide linker, and including CC an N-terminal 6xHis tag and C-terminal KDEL sequence. This novel fusion protein binds to CD7-positive T-lymphoid cells and kills them by the CC induction of apoptosis. It is an example of anti-CD7 scfv immunotoxin CC fusion proteins of the invention. An expression vector, host cells, a CC method for producing the fusion protein, and a vaccine comprising the CC fusion protein are claimed. The fusion protein is used in the treatment CC of disorders involved a hyperproliferation of CD7-positive cells, cC especially acute T-cell and/or myeloid leukaemia, and also in the CC treatment or prophylaxis of Graft-versus-host disease. A claimed method CC conditioning an animal (e.g. a human) be transplanted with donor CC cells, tissue or organ comprises: (a) depleting the CD7-bearing cell population in (a) and/or the transplant CC donor, where the CD7-bearing cell population in (a) and/or the transplant CC protein or therapeutic composition comprising the fusion protein; and (c) introducing the transplant of the fusion or therapeutic composition comprising the fusion protein; and (c)

The present sequence is that of a novel fusion protein comprising an scFv CC fragment of anti-CD7 monoclonal antibody TH-69 and domains II and III of CP seudomonas exotoxin A (ETM), joined via a peptide linker, and including CC an N-terminal 6xHis tag and C-terminal REDLK sequence. This movel fusion CC protein binds to CD7-positive T-lymphoid cells and kills them by the CM induction of apoptosis. It is an example of anti-CD7 scFv immunotoxin CC method for producing the fusion protein, and a vaccine comprising the CM fusion protein is used in the treatment CM disorders involved a hyperproliferation of CD7-positive cells, a CM especially acute T-cell and/or myeloid leukaemia, and also in the CM conditioning an animal (e.g. a human) to be transplanted with donor CM conditioning an animal (e.g. a human) to be transplanted with donor CM cells, tissue or organ comprises: (a) depleting the CD7-bearing cell condition in the animal; (b) providing a transplant comprising isolated bone marrow and/or stem cell-enriched peripheral blood cells of the CM condition or therapeutic composition comprising the fusion protein; and (c) introducing the transplant into the animal
                                                                                                                                                                                                                                                       Query Match

Sequence 7, Application US/09199149

Fatent No. 6150099

GENERAL INFORMATION:

APPLICANT: Jonak, Zdenka L.

APPLICANT: Taylor, Alexander H.

APPLICANT: Trulli Jr., Stephen H.

APPLICANT: Johanson, Kyung O.

ITILE OF INVENTION: Humanized Monoclonal Antibodies

FILE REFERENCE: P50860

CURRENT APPLICATION NUMBER: US/09/199,149

CURRENT FILING DATE: 1998-11-24

NUMBER OF SEQ ID NOS: 37

SOFTWARE: Patentin Ver. 2.0

US-09-764-304-10

Sequence 10, Application US/09764304

Patent No. US2002026036A1

GENERAL INFORMATION:

APPLICANT: HAMAI, NOBUO
APPLICANT: HAMAI, NOBUO
APPLICANT: HAMAI, NOBUO
APPLICANT: HIYAJI, HIROMASA
APPLICANT: HIYAJI, HIROMASA
APPLICANT: KUWANA, YOSHIHISA
TITLE OF INVENTION: PROCESS FOR PRODUCING HUMANIZED CHIMERA ANTIBODY
FILE REFERENCE: 249-101
CURRENT APPLICATION NUMBER: US/09/764,304
CURRENT PILING DATE: 2001-01-19
EARLIER FILING DATE: 1999-01-05
EARLIER APPLICATION NUMBER: US 08/454,680
EARLIER APPLICATION NUMBER: US 08/454,680
EARLIER APPLICATION NUMBER: US 08/408,133
EARLIER PILING DATE: 1995-09-17
EARLIER APPLICATION NUMBER: US 08/408,133
